

Green Arrow Shelling Peas

One of the most rewarding and common garden crops around. Peas prefer cool weather and soil for germination and growing, and can be planted early Spring or Fall for a second crop. Get them in quick, and once harvest starts, the more you pick the more vines will set flowers and pods.

What's a "shell" pea?

Different pea varieties are classified as "Snow", "Shell", or "Snap". **Shell** peas are varieties where you allow the pods to swell and peas to partially develop. Pods are popped open and fresh peas are "shelled" out for fresh eating, cooking or freezing.

Fun Fact: Peas help release nitrogen into the soil and will make a great companion plant for root crops. Rotate your pea patch in your garden each year for best results.

Happy Planting!

Notes:

Scientific Name: Pisum sativum

Growing Habit: A trellis will help support your plants, keep your pea pods healthy and make harvesting easier!

Where to Plant: Either direct sunlight or partial shade is best for growing peas.

How to Plant: Plant peas directly in the garden in cool soil, 2cm (1/2 to 1 inches) deep and 5-10cm (2-4 inches) apart. Your soil should be kept moist, but not soggy (the seeds can rot).

The nice thing about peas is that they don't need heavy doses of fertilizer.

Days to Harvest: 70 days for plump crunchy, sweet peas. Harvest the peas and enjoy shelling out 10 or so peas per pod.
